## What is Revanesse®?

The Revanesse® family of fillers utilizes a revolutionary method of Reticulated cross-linking by creating a copolymer of natural hyaluronic acid (HA) and cross-linked hyaluronic acid in a gel solution.

our method of cross-linking hyaluronic acid forms a stronger and more substantial bond than traditional cross linking. The result is a visco-elastic gel that is harder for your body to break down, and lasts longer than other HA fillers.

A close-up photograph of a woman's face, smiling broadly, showing her teeth. The image is partially obscured by a vertical green bar on the left side. Overlaid on the right side of the image is the text "viscous gel" in a white, serif font. The word "viscous" is in a smaller font size than "gel", and the "1" at the end of "gel" is significantly larger and more stylized.

viscous  
gel

The longer an implant remains intact, the longer you will enjoy its benefits. Viscosity is one of the most important factors in implant life. It enables Revanesse® to be more resilient to the body's attempts to absorb and break down the hyaluronic acid gel.

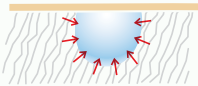

Revanesse® is perfectly safe

to use and no skin pre-test is necessary as it is obtained from bio-synthesis and is of non-animal origin.

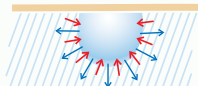

Revanesse® is naturally integrated into the tissue and allows for the passage of vital nutrients. Cells are easily able to pass between fragments of the gel leaving your skin with a perfectly healthy and natural look. Because Revanesse® is a non-permanent filler it allows clients the opportunity to reassess their needs and alter or continue their course of treatment as desired.

In the past few years, cross-linked Hyaluronic acid has become the most popular choice for dermal fillers. It is naturally present in the skin as it is vital to tissue hydration and elasticity. Revanesse® helps restore the skin to a more youthful state by acting as a replacement for the hyaluronic acid that is lost to age.

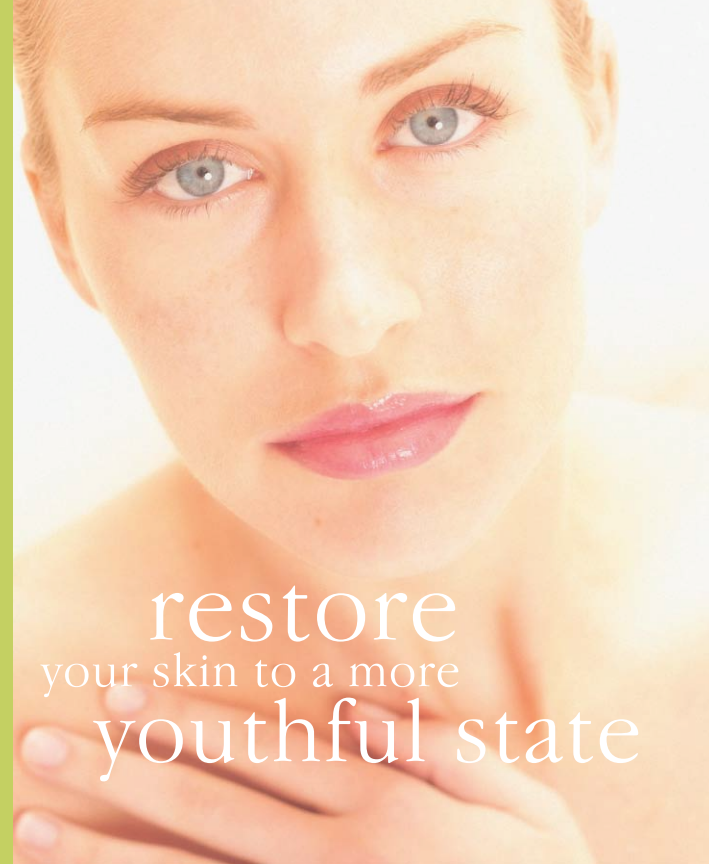

→ Traditional fillers attract water from surrounding tissue thereby damaging already damaged skin.

← The Revanesse Family of fillers replenishes this lost moisture through non-cross linked hyaluronic acid.

restore  
your skin to a more  
youthful state

# Now you have a choice...

There are two types of Revanesse® to better suit your needs.

**Revanesse®** is a cross-linked HA filler that is ideal for small to medium sized wrinkles. Revanesse® will give you natural feeling results for approximately 6 months. The Revanesse® Family offers the highest concentration of Hyaluronic acid available among dermal fillers.

**Revanesse® Ultra** is a high viscosity cross-linked HA filler that is ideal for medium to deep sized wrinkles, and is perfect for augmenting the lips. Revanesse® Ultra is made using high viscosity HA to fill deeper lines and wrinkles, and will give you natural feeling results anywhere between 9-12 months (depending on the injection site.)

Protect  
fragile areas of the skin  
from ageing

No commitment required.  
Continue your treatment as desired.

## Effectiveness

The effects of Revanesse® usually last around 6 months, while Revanesse® Ultra can last anywhere between 9-12 months before it is harmlessly broken down by the body. Results will vary depending on the amount of Revanesse® injected and the injection site.

ProLlenium has gone to great lengths to ensure a superior product that is long lasting. Revanesse® is a highly concentrated dermal filler, cross-linked using monophasic technology. These factors ensure a safe, effective and long lasting product.

Revanesse® is a quick treatment for anyone seeking more youthful looking skin. Not only will it add volume and smooth out imperfections in the skin, but the hyaluronic acid will also help protect fragile areas of the skin from ageing. Revanesse® will help replenish lost hyaluronic acid in the skin, thus leaving it well hydrated, supple and full of life. Treatment with Revanesse® will only take a few minutes. Your doctor will insert a fine needle and inject Revanesse® in the desired location. Swelling and redness will usually subside within hours and you can get back to your daily routine with little down time. Topical or local anesthetic can be used to minimize discomfort of the procedure.

# What you need to know before you get treated:

Please make sure that make-up and all other cosmetics are removed and your skin is clean. This can be done using an astringent or facial cleansing lotion. Use cold water to ensure that your pores are not dilated. It is strongly advised that you do not take any anti-inflammatories (Aspirin, Advil) at least 3-4 days prior to your treatment as it may increase bleeding and swelling at the injection site.

Get on with your daily activities  
with minimal down time.

# After you get treated:

After you are treated with Revanesse®, try to keep your face relaxed by not making any expressive facial movements. It is not advisable to expose yourself to extreme heat (eg. sauna, bath) for at least 2 weeks after the treatment as it may cause the hyaluronic acid injected to be broken down, reducing the longevity of the implant. It is also not advisable to touch or massage the area injected. You can begin to re-apply make up the day after your treatment.
